Totally eliminating animal dander is impossible as any occupant or visitor to the building can carry animal dander from their home pets on their clothes. This unlikely introduction of animal dander has been thought to be significant enough to cause allergic reactions in sensitive individuals. Before classroom pets are allowed in a classroom, each student or staff member should be questioned concerning their known allergies or asthma triggers. Classroom pets should be kept in cages and in spaces away from air flow. Under no circumstances should pet cages be placed over wall units that supply air to the room. Animal dander can be introduced to areas well beyond that classroom. Regular cleaning of these pets’ cages is a necessary part of controlling insect pests. Food for these animals needs to be kept in tough air tight containers such as jars with screw lids or heavy plastic containers with fitted lids to prevent access by insects including cockroaches.
